Technical Assessment

Create a **Svelte** frontend in **TypeScript** and **Spring Boot** services in **Kotlin** with the following functionalities,

1. List movies with artwork.
2. Add, delete and update movies.
3. Upload movie artwork.
4. List cast and creators.
5. Add, delete and update cast and creators.
6. Search movies, cast and creators.
7. Any functionalities that you think it should have.

Requirements

1. Should have **at least 2 Spring Boot services**.
2. Service-to-service communication is via **gRPC**.
3. Frontend to backend communication is via **GraphQL**.
4. Include unit tests with **complete test cases** including edge cases.

The web app should be **responsive** and **provide sufficient feedback** for the user to know the progress of the file upload, listing, updating and searching of data.

You may use AI tools such as Claude Code to help with your assignment, but all codes generated by Claude Code **you must be able to explain why**.

Important!

We value engineers who can independently understand, reason about, and own the code they deliver. While you are welcome to use AI tools to complement your work — much like using a search engine — we expect you to be able to explain any code you submit. Submissions that rely on AI as a productivity aid will not be penalised; however, we are looking for software engineers, **not prompt engineers**.

Submission

In your submission, **must** include the following:

1. Provide a git repository for us to assess your submission.
2. Provide a readme in the git repository on how to setup, run the project and how AI tools are used to create the project.

After the submission, if we decide to proceed, we will arrange a session with you to walk us through your solution.
